Part I Best Tools & CODE

Areneus

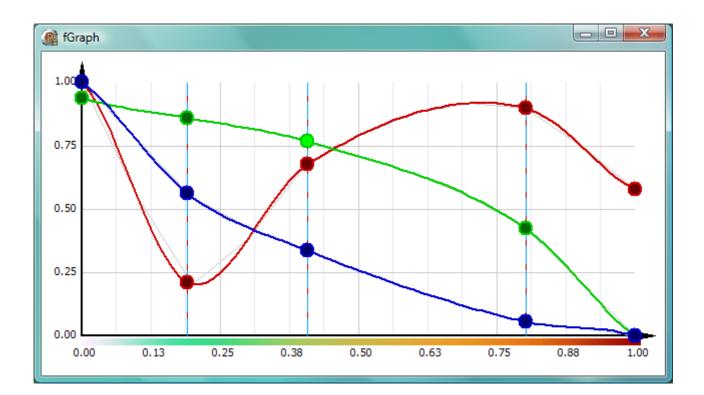

Particle Editor

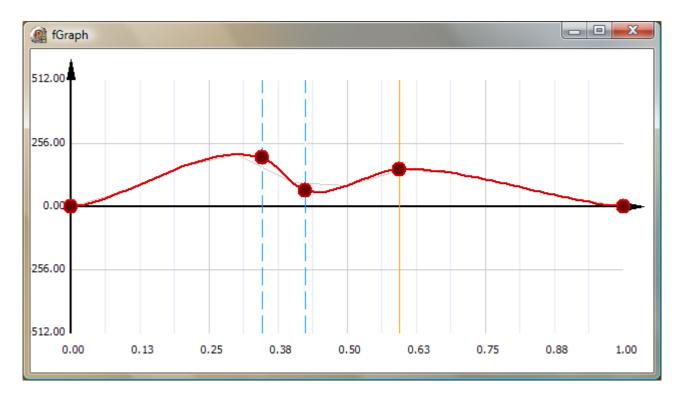

It allows creating a various effects for computer games such as fire, rain, explosions etc. We wanted to make editor very comprehensive. Creating effects is possible from the code's level and by the editor's help as well (we wanted to make it as easy as possible).

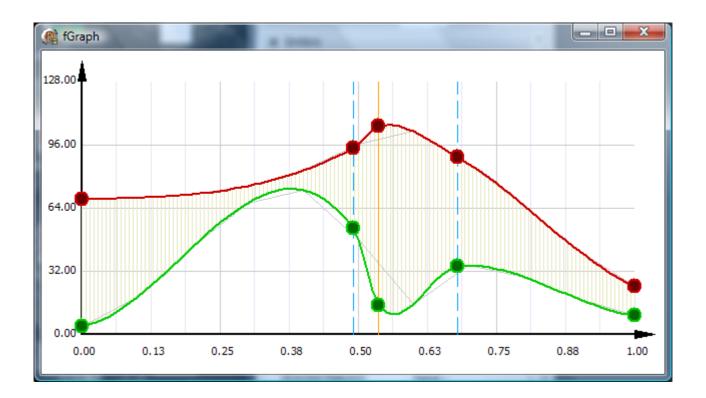

Systems created in game can be easily exported or imported in program. In addition every "point" or "emiter" has it's own GUID. Thanks to this elements created once can be used multiple times.

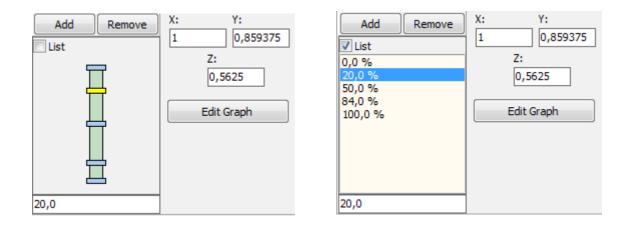

Also editor allows to create few components that will make editing of graphs much easier (this is due to fact that "Areneus" is created in "Turbo Delphi" and components were converted to "Frames"). Thanks to the components presented below, editing such attributes like changing colour over time, size or rotation is very easy.

There is also a different component, written as an alternative for graphs (his destination aren't graphs only - it also allows to attach every list, where percentage composition is located on TList).

Editor is using a serialization of classes in Delphi as main method of saving system's particles to file (known view from *.dfm files), which allows modifications without using editor.

```
object Default_System: TParticleSystem
  Specialization = [pssStencils, pssEmiters, pssPoints]
  Points = <>
  Emiters = <>
  Stencils = <
    item
      EmiterGUID = '{4F724B23-E30C-4A70-BA53-04B385139984}'
     ExternalEmiter = False
     Emiter.GUID = '{4F724B23-E30C-4A70-BA53-04B385139984}'
     Emiter.Visible = True
      Emiter.CycleLooping = True
      Emiter.CycleLength = 20.00000000000000000
      Emiter.MaxParticles = 16
      Emiter.ParticleOverload = oWait
      Emiter.RateGraph.List = (
        0s
        51s
        20s)
```

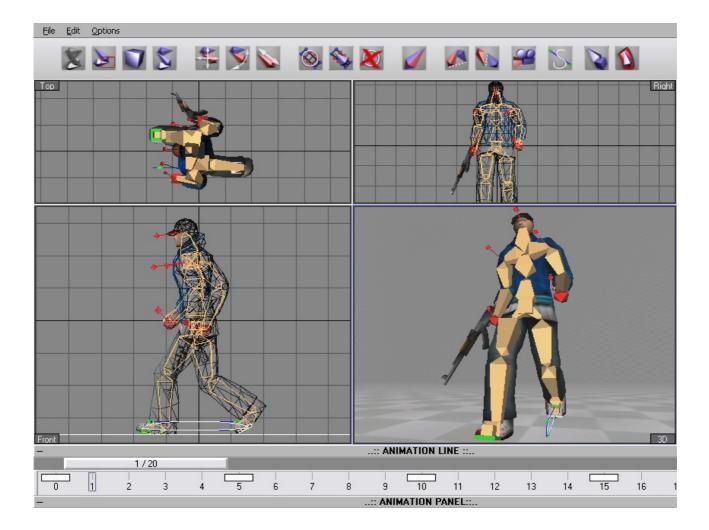

LongLeg

Editor for animations of the 3D characters

Fully functional application for 3D mesh animations.

Main features:

- bones animation
- bones connected inverse kinematics
- mesh skinning
- mesh stretching
- key frames interpolation
- interpolation of independent animations in every time
- interaction of bones in a separated skeletons
- comfortable interface
- easy to use

Map System

City Editor

Editor for maps, used in one of the demo applications (structure of city's mesh and not only)

DaThoX 2D File

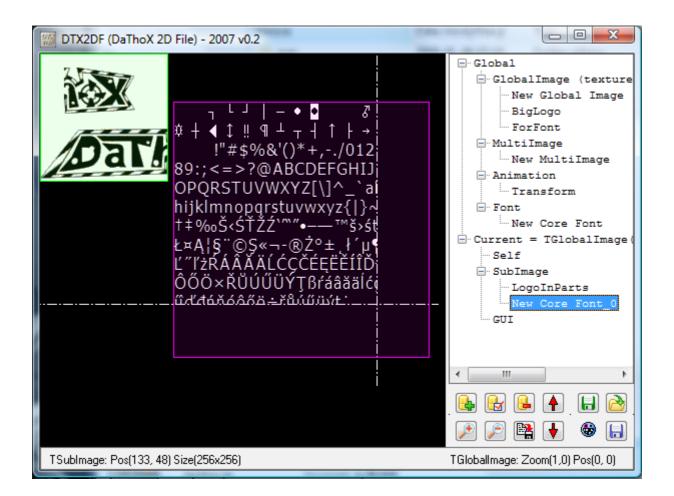

File Format & Editor

Editor of our own 2D graphic format, built for 3D engine use.

Allows to create and storage:

- Fonts
- GUI elements
- Animation
- Rotation
- Multipics

It also allows exporting format to XML file and PNG.

Our resources

Simply, the code

It is a collection from the few years of coding, lectures of different books and our own innvations as well. Our engine contains the following elements such as:

- Physics 2D/3D

- 3D graphics engine
- 2D graphics engine
- expanded mathematics

Some of our resources are shared with community (for example: mathematics, part of physics and virtual files system).

Besided the gamedev we are also interested in scrypt languages/compilers (we have our own system of parshers) thanks to this you can find in our engine different useful systems. For example: support of the external code from program/DLL libraries to scrypt languages (something like ObjAuto but also for functions, not only for methods compiled with \$METHODINFO).

```
stdcall(MyFuncPtr,
 [Par(0, dtInteger),
 Par('Treść komunikatu', dtPCHAR),
 Par('Cześć!', dtPCHAR),
 Par(Variant(MB_OK or MB_IconInformation), dtInteger)]);
```

We are doing all those things just for better game programming! In the end, games match many types of programming.

Part II Demo

DaThoX

Delphi Game Development

The following pages are showing screenshots from our demonstrations and games presenting how physics and graphics would work. They show features of our engine. First three are presenting our current game we are working on. Have a nice watching!

Part III Other Tools

TxtEdit

Translation tool

Easy and useful system for translating languages, also containing an editor and generator of modules in Object Pascal language. This system has a very useful library allowing autmatisation of using different languages (with detecting default language).

Other Game Tools

Fonts, Configurators, Conventers

We also created many other, small and useful tools like font generators, sky editors or applications for taking out informations about OpenGL or for configurating the games. One of our creations was a "semi-compiler" for creating installers for addons to the popular mini-game Little Fighter 2.

Other Tools

and so on

But Gamedev isn't everything. We've also created ...

Many useful small tools.
